## Diurnal Variation of IOP

**Marwa Abd El-Kader Fouly**  
*Research Institute of  
Ophthalmology*

## Thesis

Supervised by

**Dr. Mohamed Adel Abdelshafik**  
*Professor of Ophthalmology,  
 Faculty of medicine Ain Shams University*

**Dr. Ahmad Khalil Khalil**  
*Professor of Ophthalmology,  
 Research Institute of Ophthalmology*

**Dr. Sherein Shafik Wahba**  
*Asst. Professor of ophthalmology,  
 Faculty of medicine Ain Shams University*

## *Aqueous humor dynamics*

*The intraocular pressure is pulsatile in nature, having a normal magnitude of 2mmHg*

*Tracing of IOP made with a pneumotonometer*

(Leydhecker W, 1976)

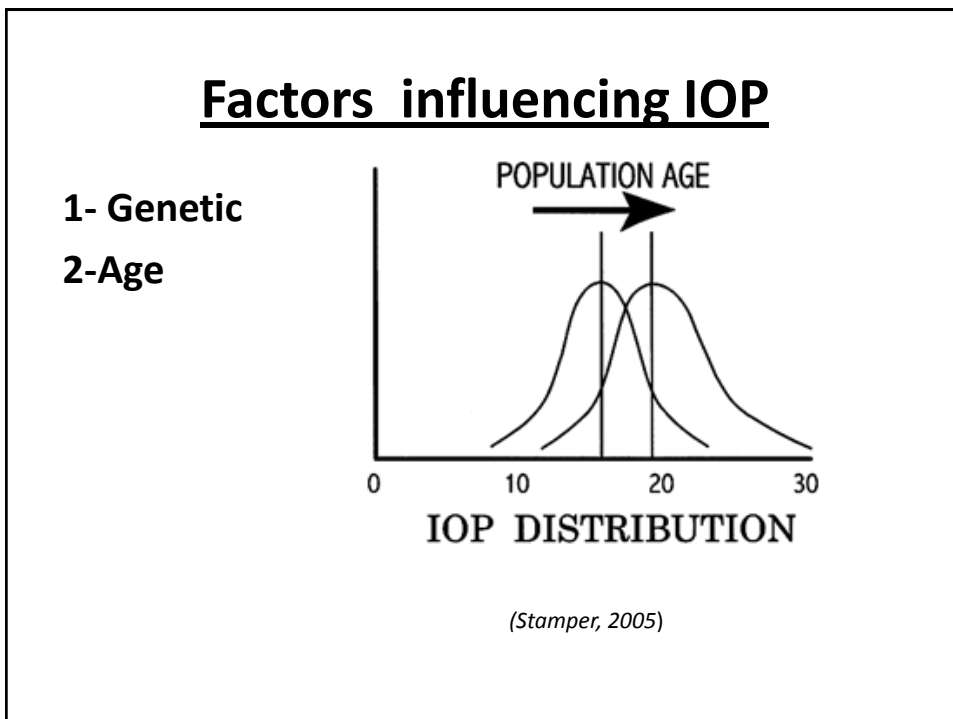

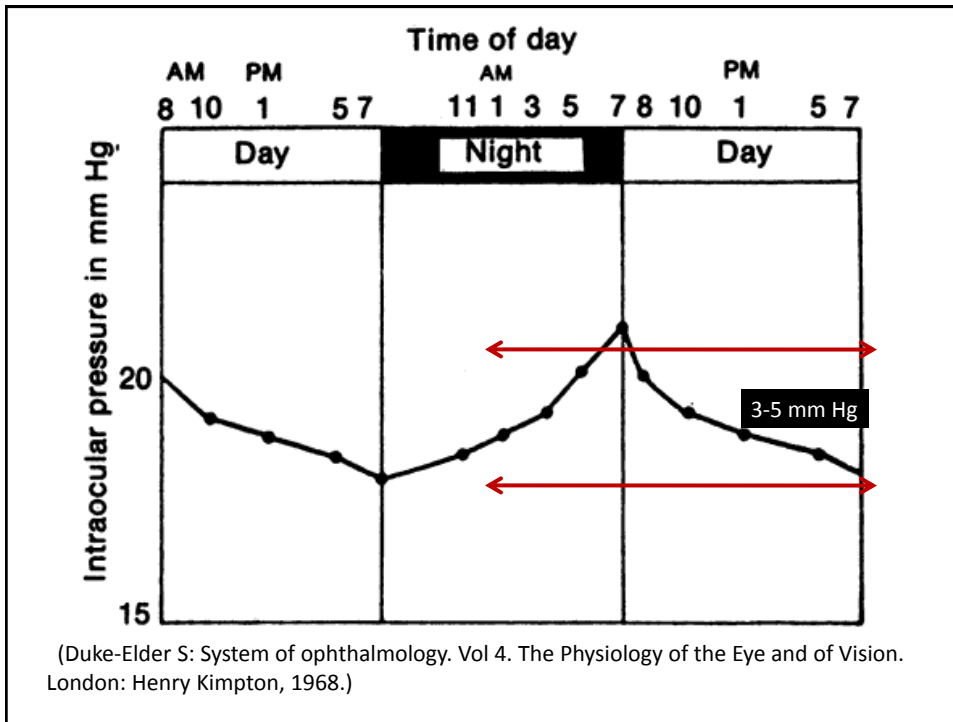

The average intraocular pressure is around  
15 mmHg.

*(Hoskins HD et al, 1989).*

16

- Data large epidemiologic study :  
mean IOP is @ 16 mmHg and SD of 3 .( Moses R&  
Hart W, 1987)

## **Factors influencing IOP**

**3-Sex**

**4-Race**

**5- Change in body position**

**6-Systemic Factors : Hypertension- DM**

**7-Pregnancy**

**8-Smoking**

## **Factors influencing IOP (Ocular Related)**

**1-Axial Length**

**2-Laterality**

**3-Central Corneal Thickness**

**4-Corneal Curvature**

**5-Corneal anomalies**

**7-Others ocular conditions : squeezing**

## Aim of the work

To find out the pattern of diurnal variation among some Egyptian population.

## ***Subjects and Methods***

- 163 eyes of 86 :
  - of non-glaucomatous patients scheduled for ocular surgeries &
  - volunteers at RIO
- IOP was measured 5 times along one day (8am, 12pm, 4pm, 8pm, and 12am).

- History
  - age, sex, past or present history of any ocular surgeries, medication, or trauma.
  
- Ocular examination :
  - Visual Acuity :ranging from (6/6) - (3/60)
  - Slit-Lamp for anterior segment examination to exclude potential causes of high IOP.
  - IOP measurement using Goldmann applanation tonometer mounted on slit-lamp.

## ***Results***

The mean IOP of the studied group all over the day was 16.4 mmHg (SD  $\pm$ 2.5)

Patients were divided into 4 groups according to the age:

Group 1: age from 10- 30 years

Group 2: age from 30- 50 years

Group 3: age from 50- 70 years

Group 4: age from 70- 90 years

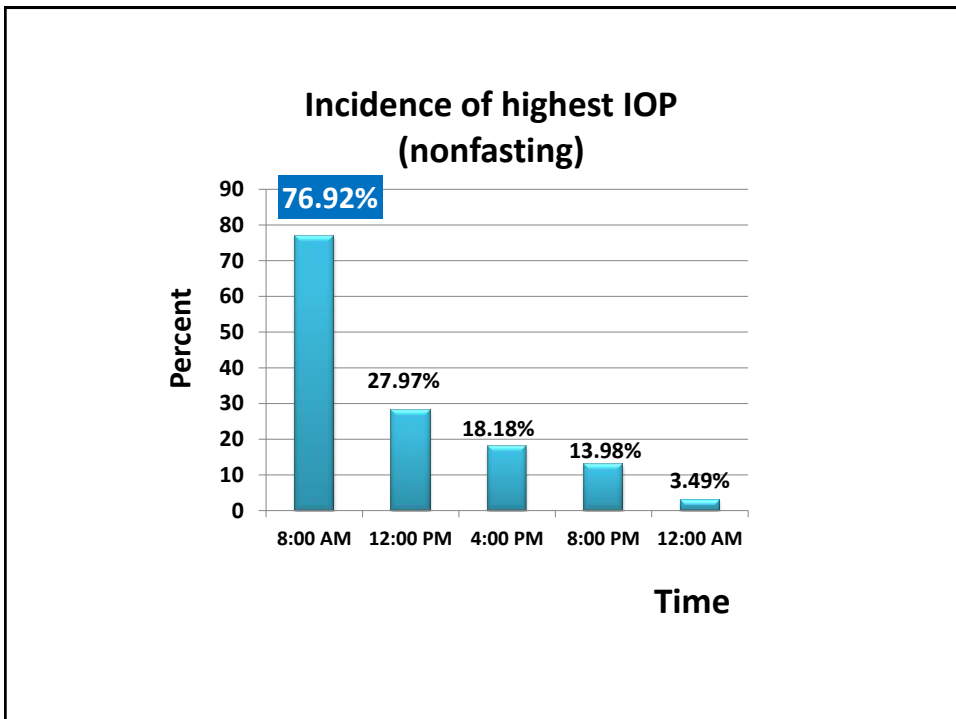

Group	Number of eyes	Mean IOP(mmHg)& SD
Group 1 (age from 10- 30 years)	16	17.3±1.7
Group 2 (age from 30- 50 years)	18	16.6± 1.1
Group 3 (age from 50- 70 years)	90	15.9± 1.8
Group 4 (age from 70- 90 years)	39	14.4± 1.5

Table shows mean IOP among different age groups.

## To find the pattern of fluctuation

- The curve of IOP was drawn for each patient. Similar curves were grouped.
- There were **43 patterns** detected in the 163 eyes

Following are patterns found in a larger number of cases.

*Discussion*

## Age

- The present study showed that the IOP decreases with age
- This does not agree with the generally accepted notion that IOP in the elderly is higher than that in the young adult, at least during the light/wake period (*Shields et al, 2005*)
- This could be due to small sample size

**RIGHT VERSUS LEFT**

## Right versus left

- Present study shows:
  - that in most of the time the difference between the two eyes was minimum (0-1 mmHg in 88%)&
  - a difference (2-4 mmHg) was only found in 12% of the studied group.
- Others:
  - The difference between the two eyes rarely exceeds 4 mmHg (*Leske et al, 1997*).

## Highest reading

- ***Katavisto, 1964 :***
  1. the 'morning type' peak in the early morning,
  2. the 'day time' peak during the day
  3. the 'night type' peak during the night.
  4. the 'flat type' without obvious peaks.

Katavisto M. The diurnal variations of ocular tension in glaucoma. Acta Ophthalmol (Copenh) 1964, 78:1.

## In the present study

- The variation of IOP over the day had a predominance of morning peaks .

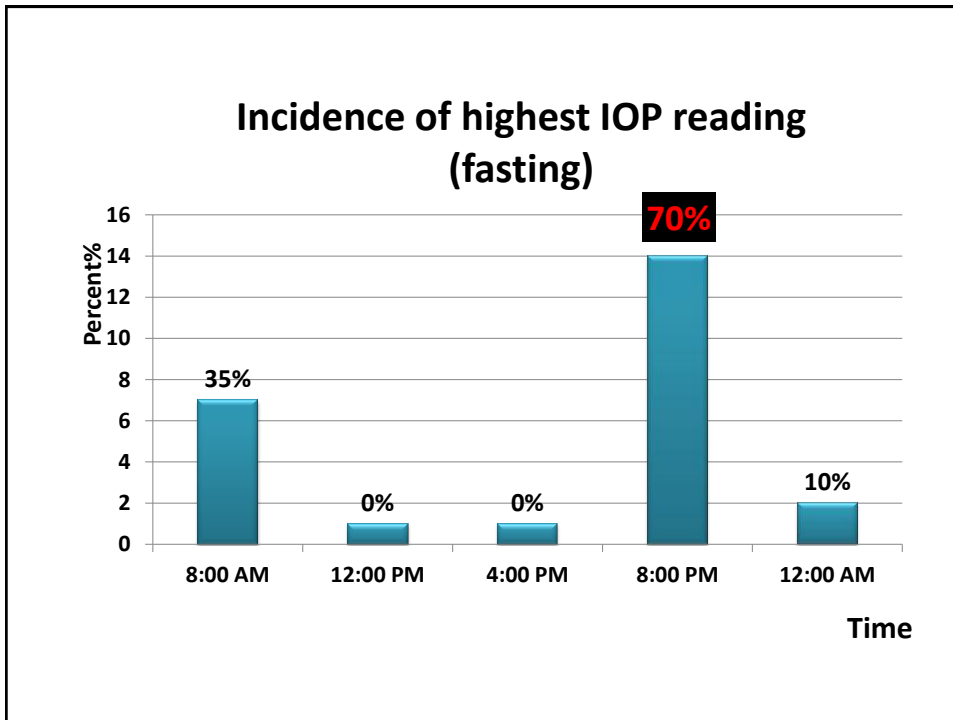

- This is in agreement with findings of others (*Collaer et al, 2005*).

## “This morning peak”

- So probability of catching the high IOP is more in the morning.
- Measure IOP in the early working office hours rather than by the end of the day to catch the highest reading of the day.

**HIGHEST READING WHILE FASTING !**

## fasting in Ramadan

- The highest IOP was found to be at 8 PM (70%).
- Consider the effect of drinking water at time maghrib among Muslim glaucomatous patients.
  - Measurement
  - Drug therapy

## **FLUCTUATION (FASTING VS NON FASTING )**

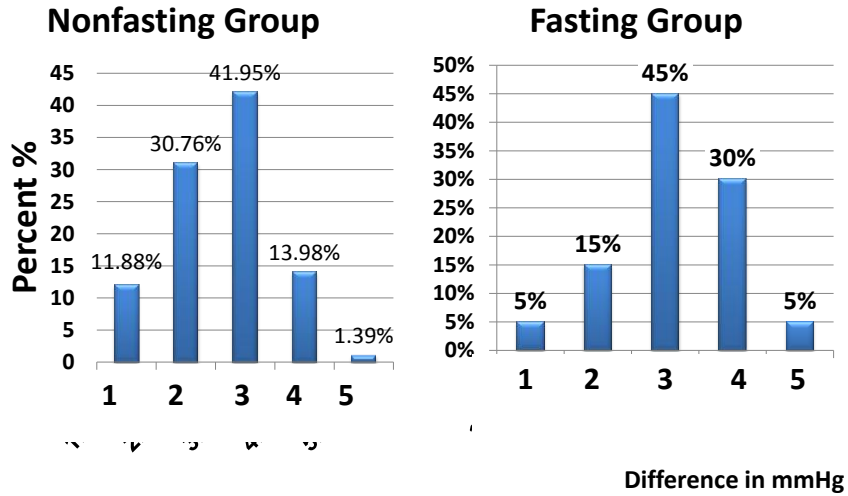

***(Dueker, 2005)*** : In normal individual IOP varies 2-6 mmHg over a 24 hours period

**In the present study :**

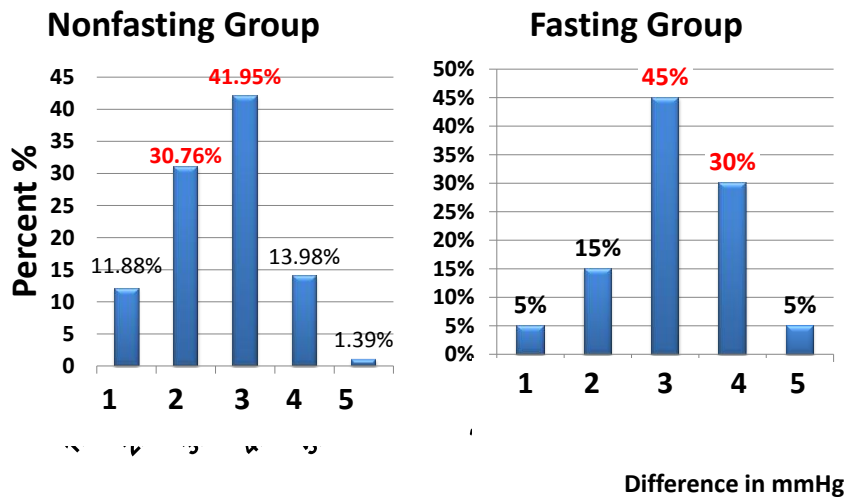

In the nonfasting group (143patients) it ranges from 1-5 mmHg.

## Fluctuation (fasting vs non fasting )

## Fluctuation (fasting vs non fasting )

## 4 vs 8 pm

<i>IOP at 8 PM compared to 4 PM in mmHg</i>	<i>Fasting group</i>	<i>Nonfasting of group 3</i>
-3	0	1
-2	1	9
-1	1	28
0	2	23
1	2	4
2	3	1
3	6	3
4	4	1
5	1	0
<b>Total number of cases</b>	<b>20</b>	<b>70</b>
